

C++11 CSP

Because we haven't built enough CSP libraries

Dr Kevin Chalmers

School of Computing
Edinburgh Napier University
Edinburgh

`k.chalmers@napier.ac.uk`

Edinburgh Napier
UNIVERSITY

Before we get started...

- Yes you can pull it (although it needs more testing)
- <https://github.com/kevin-chalmers/cpp11-csp>

- 1 OK why did you do this?
- 2 OK, but why did you really do this?
- 3 But C++ is old hat!
- 4 How to use C++11 CSP
- 5 Some Examples
- 6 Patterns and Networking and Other Stuff
- 7 Summary

- 1 OK why did you do this?
- 2 OK, but why did you really do this?
- 3 But C++ is old hat!
- 4 How to use C++11 CSP
- 5 Some Examples
- 6 Patterns and Networking and Other Stuff
- 7 Summary

Little Trajectory - occam to networking

- I started off working with JCSP way back in 2004
 - Undergraduate module in Design Patterns including parallel
 - An iteration of material Jon had been running as occam for years
- My undergraduate project looked at code mobility in JCSP
- My PhD work looked at networking and networked mobility

Little Trajectory - networking to occam

- One outcome of this work was a generalised protocol for networked channel communications
- I developed a .NET version
 - Connecting, via channels, JCSP and .NET CSP
- I then set off an occam journey, trying to implement the networking stack
 - And it was too hard
 - The networking stack relied too heavily on object-orientation ideas and some data sharing

Stepping Back - C and MPI

- So I took a step back and thought about redesigning in another language
 - C and C++ being the most likely
 - Cross runtime potential with foreign function interface
 - I'll get back to this
- As a sidetrack I started exploring MPI to compare against what I had
 - De facto standard for message passing in distributed parallel
- I became interested in MPI as a potential comm layer, but this requires a redesign of networking
 - Too stream focused
- So, I am really trying to create a framework which sits on top of MPI
 - And the simplest method was to move away from Java to C or C++

An aside - C++CSP Already Exists!

- Neil Brown did a lot of work on a C++ version of a CSP library
- Also created C++CSP2
- Also created C++CSP2 Networked
- So why not just use Neil's work?
- Well, C++CSP2 is not very extensible
 - Couldn't implement the networked channel model I had easily
 - Would have to strip down C++CSP2 to achieve what I wanted
 - Also relied heavily on Boost and OS specific libraries

- 1 OK why did you do this?
- 2 OK, but why did you really do this?**
- 3 But C++ is old hat!
- 4 How to use C++11 CSP
- 5 Some Examples
- 6 Patterns and Networking and Other Stuff
- 7 Summary

- Oh how much do I hate writing JCSP code!
- Actually, I hate writing Java code - JCSP does a good job of hiding Javaisms™(Chalmers 2015)
- I want to decide if I am passing by value or reference
- I want to decide how and when an object is destroyed
- I want to override operators
- I could go on...

I like the expressiveness of parallel computation in occam

- I do - *even though I've never been an occam programmer*
- What I don't like is the lack of libraries
 - As a programmer I find libraries more important than the language
 - I can work round the language with APIs
- I also find occam a little archaic
 - But let's not start an argument about it
- So I want the simplicity of occam, but with massive library and platform support
- These two issues quite happily collided

- 1 OK why did you do this?
- 2 OK, but why did you really do this?
- 3 But C++ is old hat!**
- 4 How to use C++11 CSP
- 5 Some Examples
- 6 Patterns and Networking and Other Stuff
- 7 Summary

C++11 - Not your grandfather's C++

- C++ is an object-oriented language
 - No - but you can write object-oriented code with C++
 - A lot of Java programmers (including me) write bad C++ code
- C++ is too complex
 - Depends on your approach - you can write complex code with C++
 - I like to tell students that C++ is not a forgiving language
- C++ relies on pointers
 - No - most C programmers wrote a lot of bad C++ code
- What C++ is is up for debate
 - It is multi-paradigm. If actor models take off you can guarantee that C++ will get `send` and `receive` or similar

- OK, there are a lot, so I'll summarise the important bits

Smart pointers Automatic release of resources - no need for `new` and `delete`

Lambda Expressions You can do pretty much standard functional language stuff - it just gets pretty ugly

Move semantics You can now *move* resources as well as copy and reference

- Yes, this is just *occam- π* mobile data types

Initializer lists Create collections using braces to denote the members

Variadic templates Compiler does more work for the type

Concurrency **FINALLY!** We get

- Thread
- Mutex
- Future
- etc.

- OK, last slide before getting onto some code
- Modern C++ design encourages the following approaches
 - Avoid pointers** Most memory should have a handler object that looks after the resource
 - PIMPL** Private implementation objects surrounded by a handler
 - RAII** Resource lifetime is linked to the lifetime of its owner
 - Generic programming** Templates to create reusable code

- 1 OK why did you do this?
- 2 OK, but why did you really do this?
- 3 But C++ is old hat!
- 4 How to use C++11 CSP**
- 5 Some Examples
- 6 Patterns and Networking and Other Stuff
- 7 Summary

Creating and Using Channels

```
// Channels are typed
one2one_chan<int> c;
// Operator overloads for read and write
auto x = c();
c(x);
// Also overloads to automatically convert to chan_in,
    chan_out, etc.
```

Processes are Just Functions

```
// Lambda expression
auto send = [&]() { c(5); };
auto recv = [&]() { cout << c() << endl; };
// Can also bind functions with values
// void sender(chan_out<int> c)
// void receiver(chan_in<int> c)
fork f1(make_proc(sender, c));
fork f2(make_proc(reciever, c));
f1();
f2();
```

par uses Initializer Lists

```
// Parallel now looks like a control block
par
{
    prefix(0, a, b),
    delta(b, {c, d}),
    succ(c, a),
    printer("", "", d)
}();
```

- I'd like to do something similar with alt - have an idea for that

- 1 OK why did you do this?
- 2 OK, but why did you really do this?

- 4 How to use C++11 CSP
- 5 Some Examples**
- 6 Patterns and Networking and Other Stuff
- 7 Summary

- 1 OK why did you do this?
- 2 OK, but why did you really do this?
- 3 But C++ is old hat!
- 4 How to use C++11 CSP
- 5 Some Examples
- 6 Patterns and Networking and Other Stuff**
- 7 Summary

There is still a bit I'd like to do...

- Building the pattern functions for C++11 CSP got me interested in parallel patterns
 - I'll talk about this more tomorrow
- I'm almost there with a new networking stack
 - Far more versatile and extensible
 - Will require only little bits of code to enable new comm layers
- I'd like automatic fork management (i.e. you fork a process you have to wait for it to complete)
- I'd like other syntactic sugar approaches built in (e.g. `alt`)

- 1 OK why did you do this?
- 2 OK, but why did you really do this?
- 3 But C++ is old hat!
- 4 How to use C++11 CSP
- 5 Some Examples
- 6 Patterns and Networking and Other Stuff
- 7 Summary**

- This is very much a pet project to let me explore ideas
- I'm not aiming for performance, but simplicity of code
- My main aim is to build a new MPI supported network stack for channel processes
- And hopefully stick that into Go, Rust, etc.
- So, happy enough to share code, but don't expect support at the moment

Questions?
