

The SCOOP Concurrency Model in Java-like Languages

Faraz TORSHIZI^a, Jonathan S. OSTROFF^b, Richard F. PAIGE^c and Marsha CHECHIK^a

^a *University of Toronto, Canada*

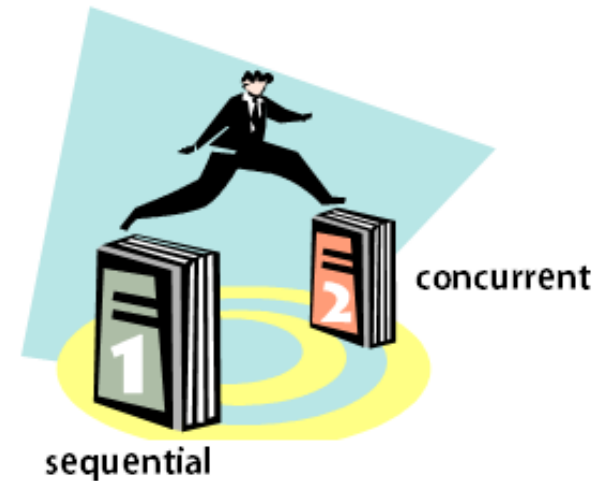

^b *York University, Canada*

^c *University of York, UK*

`http://www.cs.toronto.edu/~faraz`

Why SCOOP?

- Techniques for writing concurrent code are still low-level
 - semaphores, locks, sync blocks, monitors etc.
 - hard to test and maintain
- There is a large gap between the above mechanisms and the popular object-oriented concepts
- The SCOOP model [Meyer97] is an attempt to bridge this gap in OO context
 - Originally developed for Eiffel language

What is SCOOP?

Simple Concurrent Object Oriented Programming

- Basic concept of OO computation: routine call **$x.f(a)$**

What is SCOOP?

Simple Concurrent Object Oriented Programming

- Basic concept of OO computation: routine call **$x.f(a)$**
- SCOOP adds the notion of a **processor** (handler)
- Processor is an **abstract concept** used to define behavior

The “separate” keyword

- **$x.f(a)$** – execute routine f on the object attached to x .
- In a sequential context f is **synchronous**
- In a concurrent context, if x denotes an object handled by another processor, f is **asynchronous**
- This semantic difference (synchronous vs. asynchronous) has a syntactic marker: **separate**

Separate call

x : **separate** X

...

$x.f(a)$

SCOOP requirements

- **Handling:** All calls on an object are executed by its associated processor (no object sharing)
- **Mutual exclusion:** At most one method may execute on an object at a time
- **Separateness:**
 - Calls on *non-separate* objects are *synchronous*
 - Calls on *separate* objects are *asynchronous*

SCOOP programs are free of data races and atomicity violations by construction

```

class PHILOSOPHER

create
  make

feature
  left, right: separate FORK

  make (l, r: separate FORK)
    do
      left := l; right := r
    end

  act
    do
      from until False loop
        eat (left, right)
      end
    end

  eat (l, r: separate FORK)
    require not (l.inuse or r.inuse)
    do
      l.pickup; r.pickup
      -- local activity --
      l.putdown; r.putdown
    end

```

```

class FORK

feature
  inuse: BOOLEAN

  pickup is
    do
      inuse := True
    end

  putdown is
    do
      inuse := False
    end

end

```

```
class PHILOSOPHER
```

```
create  
  make
```

```
feature  
  left, right: separate FORK
```

```
  make (l, r: separate FORK)  
    do  
      left := l; right := r  
    end
```

```
  act  
    do  
      from until False loop  
        eat (left, right)  
      end  
    end
```

```
  eat (l, r: separate FORK)  
    require not (l.inuse or r.inuse)  
    do  
      l.pickup; r.pickup  
      -- local activity --  
      l.putdown; r.putdown  
    end
```

Using sequential library
in concurrent context

```
class FORK
```

```
feature  
  inuse: BOOLEAN
```

```
  pickup is  
    do  
      inuse := True  
    end
```

```
  putdown is  
    do  
      inuse := False  
    end
```

```
end
```

```
class PHILOSOPHER
```

```
create  
  make
```

```
feature  
  left, right: separate FORK
```

```
  make (l, r: separate FORK)  
  do  
    left := l; right := r  
  end
```

```
  act  
  do  
    from until False loop  
    eat (left, right)  
  end  
end
```

```
eat (l, r: separate FORK)  
require not (l.inuse or r.inuse)  
do  
  l.pickup; r.pickup  
  -- local activity --  
  l.putdown; r.putdown  
end
```

Using sequential library
in concurrent context

```
class FORK
```

```
feature  
  inuse: BOOLEAN  
  
  pickup is  
  do  
    inuse := True  
  end  
  
  putdown is  
  do  
    inuse := False  
  end  
  
end
```

Automatic locking of
arguments

```
class PHILOSOPHER
```

```
create  
  make
```

```
feature  
  left, right: separate FORK
```

```
  make (l, r: separate FORK)  
  do  
    left := l; right := r  
  end
```

```
  act  
  do  
    from until False loop  
    eat (left, right)  
  end  
end
```

```
  eat (l, r: separate FORK)  
  require not (l.inuse or r.inuse)  
  do  
    l.pickup; r.pickup  
    -- local activity --  
    l.putdown; r.putdown  
  end
```

Using sequential library
in concurrent context

```
class FORK
```

```
feature  
  inuse: BOOLEAN
```

```
  pickup is  
  do  
    inuse := True  
  end
```

```
  putdown is  
  do  
    inuse := False  
  end
```

```
end
```

Automatic locking of
arguments

Wait condition

```
class PHILOSOPHER
```

```
create  
  make
```

```
feature  
  left, right: separate FORK
```

```
  make (l, r: separate FORK)  
  do  
    left := l; right := r  
  end
```

```
  act  
  do  
    from until False loop  
    eat (left, right)  
  end  
end
```

```
  eat (l, r: separate FORK)  
  require not (l.inuse or r.inuse)  
  do  
    l.pickup; r.pickup  
    -- local activity --  
    l.putdown; r.putdown  
  end
```

Using sequential library
in concurrent context

```
class FORK
```

```
feature  
  inuse: BOOLEAN
```

```
  pickup is  
  do  
    inuse := True  
  end
```

```
  putdown is  
  do  
    inuse := False  
  end
```

```
end
```

Automatic locking of
arguments

Wait condition

Async calls

Our Goal

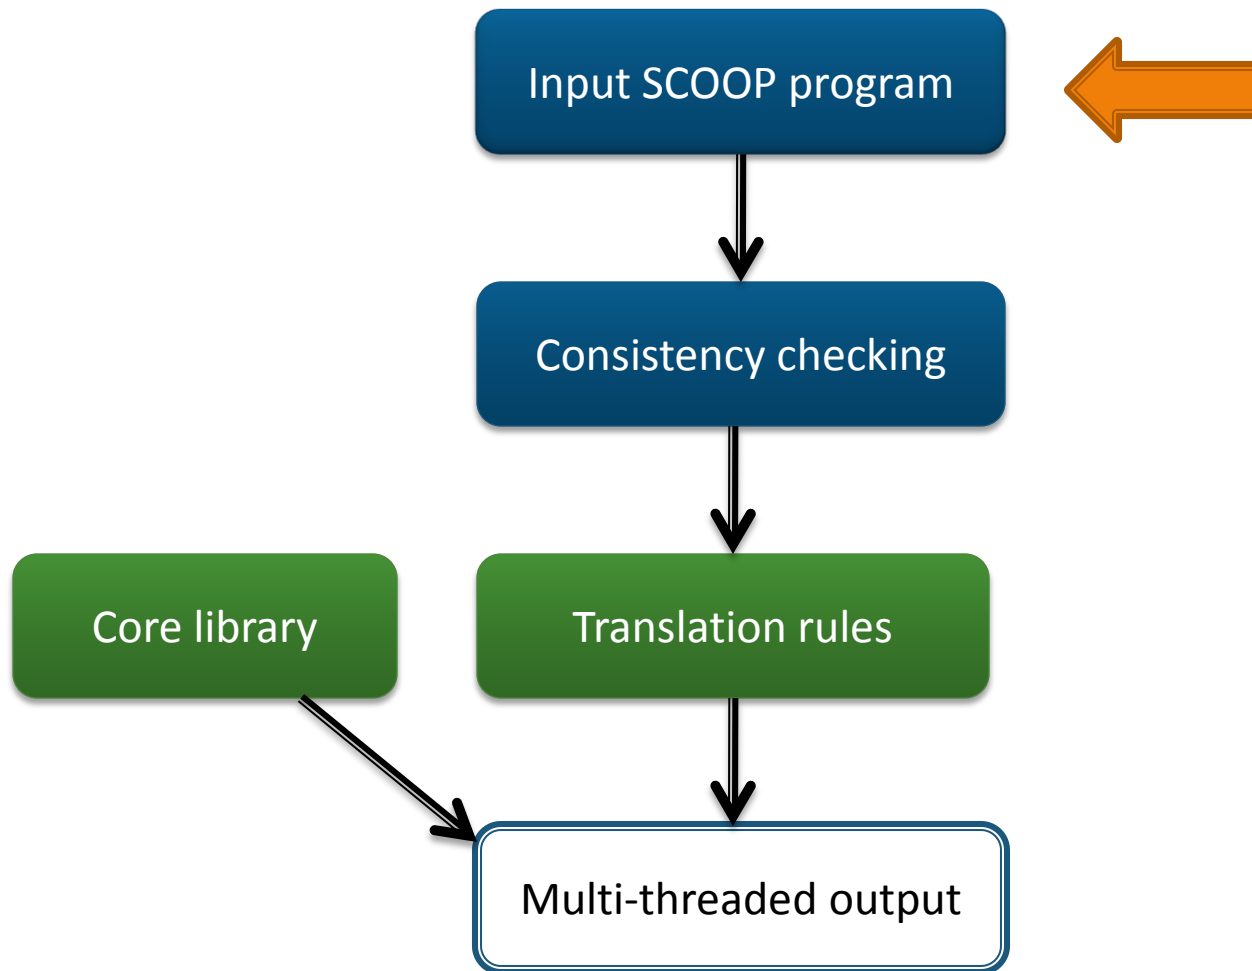

- The SCOOP model is developed as an extension to Eiffel language

- A pattern for SCOOP that makes it feasible to apply the SCOOP concurrency model to other OO languages

Architecture

Input SCOOP program

- To write the SCOOP program we use the **meta-data facility** of the supporting language
- Annotations in Java and attributes in C#
- One keyword in Eiffel (**separate**) vs. two annotations in other languages (**separate** and **await**)

Annotated Java: JSCOOP

```
public class Philosopher {
    private @separate Fork rightFork;
    private @separate Fork leftFork;

    public Philosopher (@separate Fork l, @separate Fork r) {
        leftFork = l; rightFork = r;
    }

    public void act() {
        while(true) {
            eat(leftFork, rightFork); //non-separate call
        }
    }

    @await("!l.isInUse() &&!r.isInUse()")
    public void eat(@separate Fork l, @separate Fork r) {
        l.pickUp(); r.pickUp(); // separate calls
        if(l.isInUse() && r.isInUse()) {
            l.putDown(); r.putDown();
        }
    }
}
```

Annotated C#: CSCOOOP

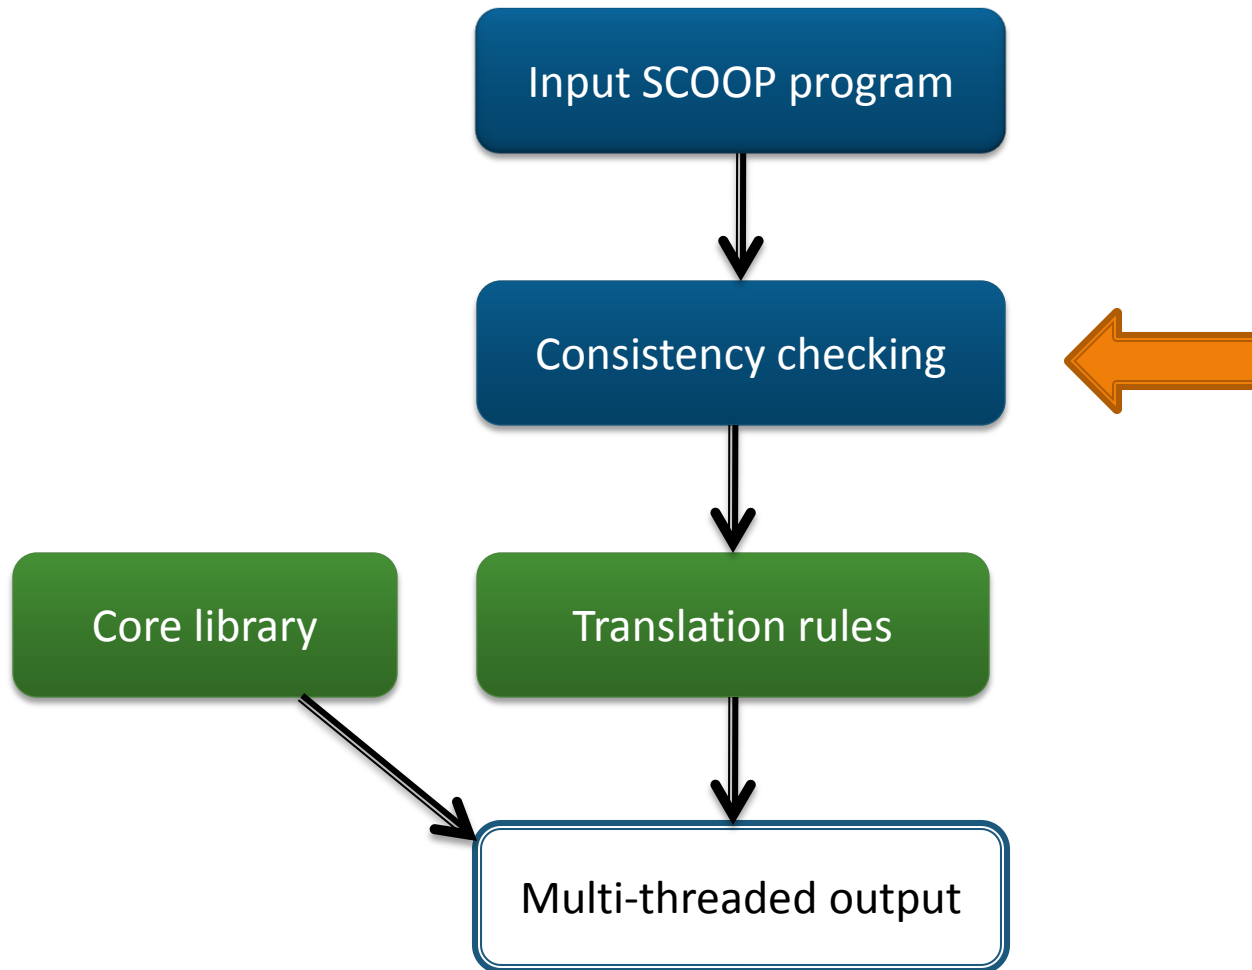

```
public class Philosopher {
    [separate] private Fork rightFork;
    [separate] private Fork leftFork;

    public Philosopher ([separate] Fork l, [separate] Fork r) {
        leftFork = l; rightFork = r;
    }

    public void act() {
        while(true) {
            eat(leftFork, rightFork); //non-separate call
        }
    }

    [await ("!l.isInUse() && !r.isInUse()")]
    public void eat([separate] Fork l, [separate] Fork r) {
        l.pickUp(); r.pickUp();
        if(l.isInUse() && r.isInUse()) {
            l.putDown(); r.putDown();
        }
    }
}
```

Architecture

Consistency issues

```
@separate X x1;  
A a1;  
...  
public void r (@separate X x)  
{  
    a1 = x.a2;  
}  
...  
r (x1);  
a1....
```

Client

```
public class X {  
    A a2;  
    ...  
}
```

Supplier

Consistency issues

```
@separate X x1;  
A a1;  
...  
public void r (@separate X x)  
{  
    a1 = x.a2;  
}  
...  
r (x1);  
a1....
```

Client

```
public class X {  
    A a2;  
    ...  
}
```

Supplier

Consistency issues

```
@separate X x1;  
A a1;  
...  
public void r (@separate X x)  
{  
    a1 = x.a2;  
}  
...  
r (x1);  
a1....
```

Datarace on a1

Client

```
public class X {  
    A a2;  
    ...  
}
```

Supplier

Consistency issues

```
@separate X x1;  
A a1;  
...  
public void r (@separate X x)  
{  
    a1 = x.a2;  
}  
...  
r (x1);  
a1....
```

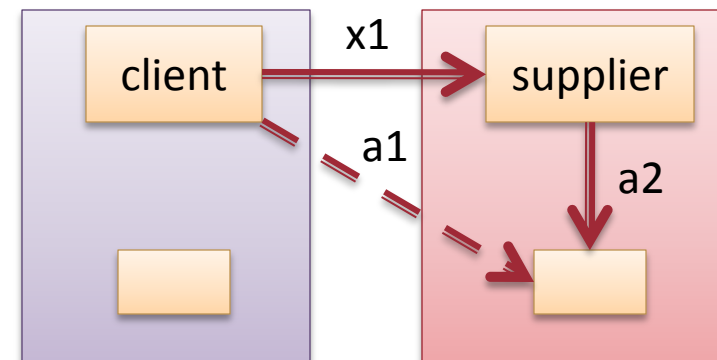

Not allowed -- Compile-time error

Datarace on a1

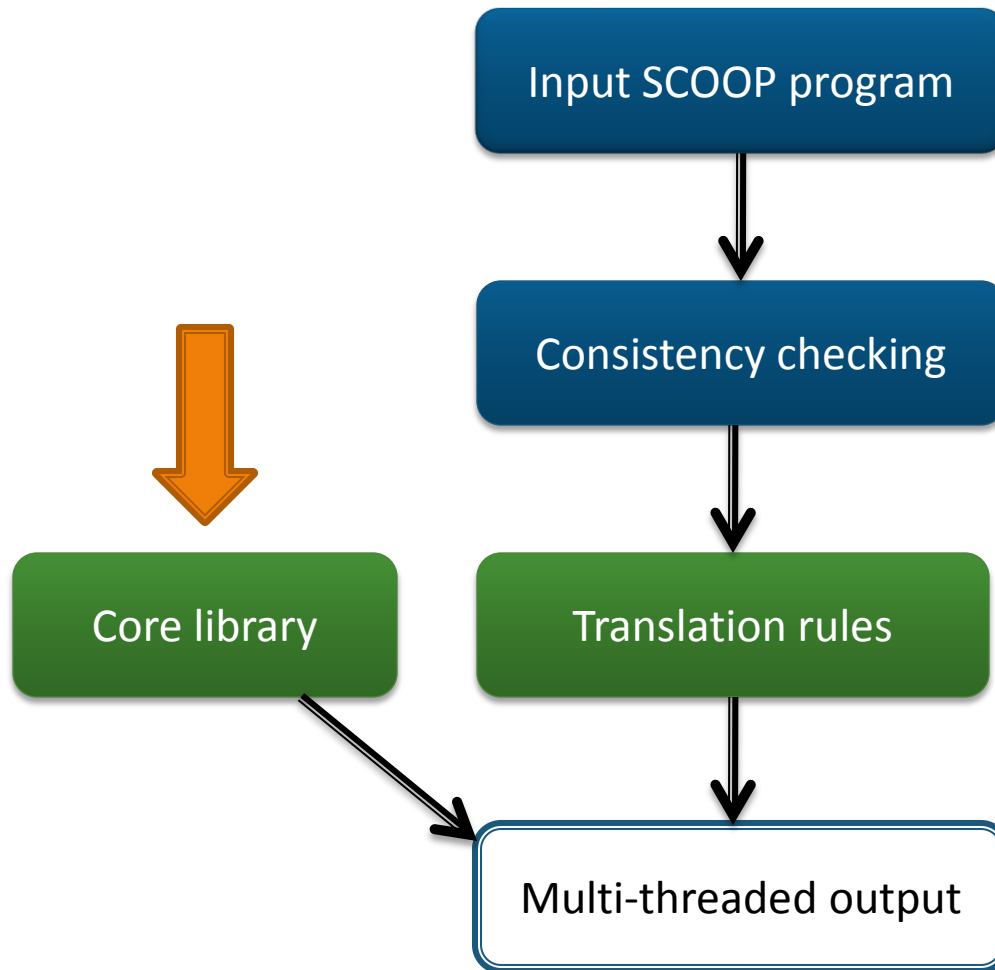

Client

```
public class X {  
    A a2;  
    ...  
}
```

Supplier

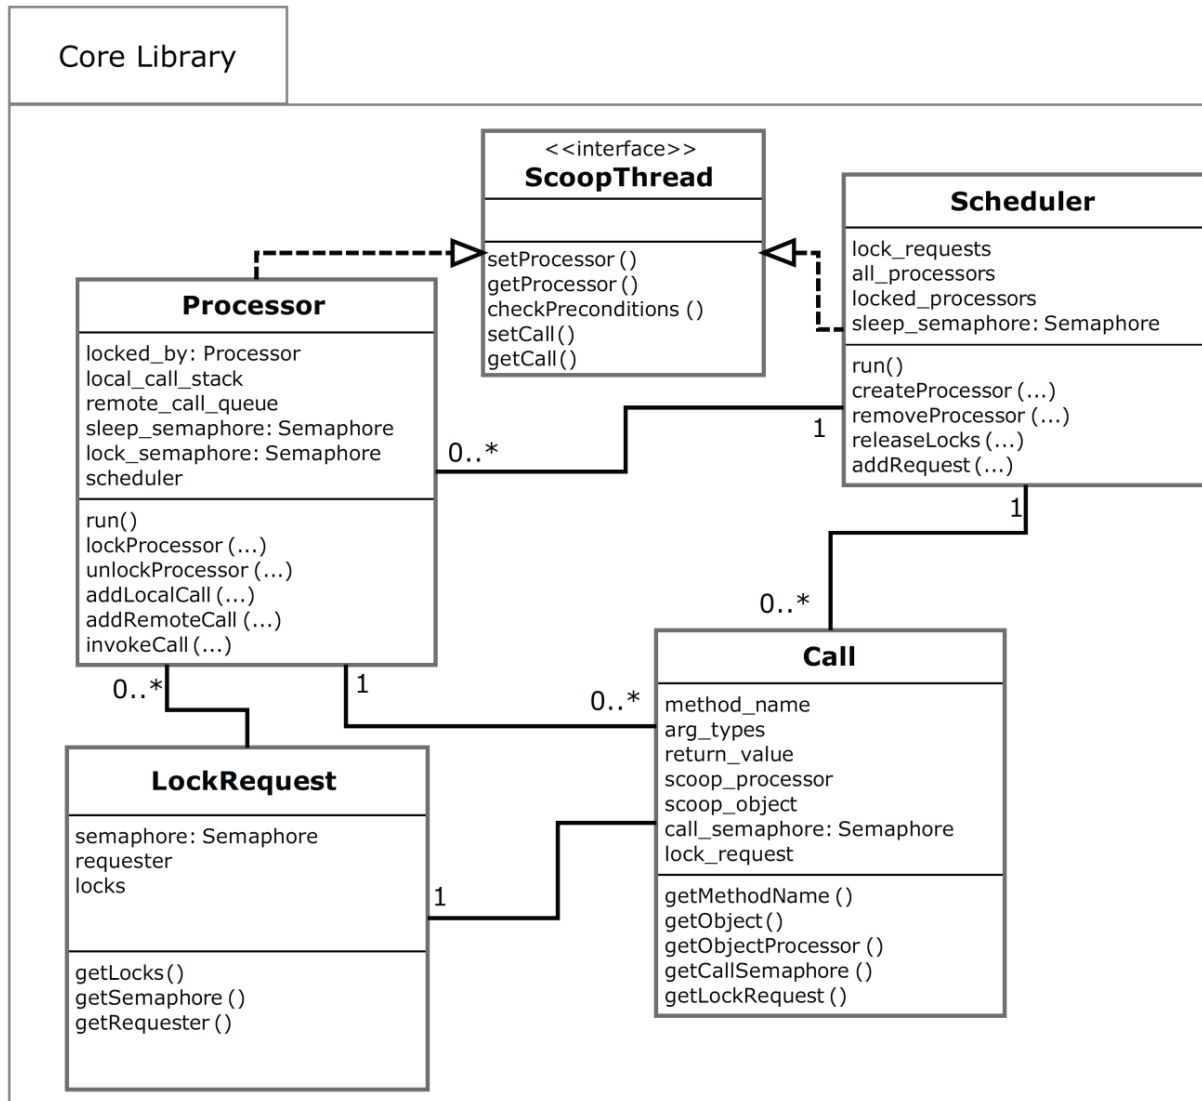

Architecture

Core library

- The core library provides the essentials for modeling SCOOP:
 - Processors
 - Separate and non-separate calls
 - Atomic locking of multiple resources
 - Wait semantics
 - Wait-by-necessity
 - Fair scheduling

Core library

Processor

- Processors are instances of the **Processor** class.
- Every processor has a
 - **Local call stack** for local calls
 - **Remote call queue** for remote calls
- Processor repeatedly performs the following:
 1. Pops an item off the stack and executes it
 2. If the stack is empty, dequeues an item from the remote call queue and pushes it onto the local call stack
 3. If both the stack and the queue are empty, waits for new requests to be enqueued

SCOOP dynamic behavior

```
public class A
{
    @separate B b;
    @separate C c;
    ...
    → this.m(b, c);
    ...
    @await("condition()")
    public void m(@separate B bb, @separate C cc) {
        bb.f();
        cc.g();
        ...
    }
    ...
}
```

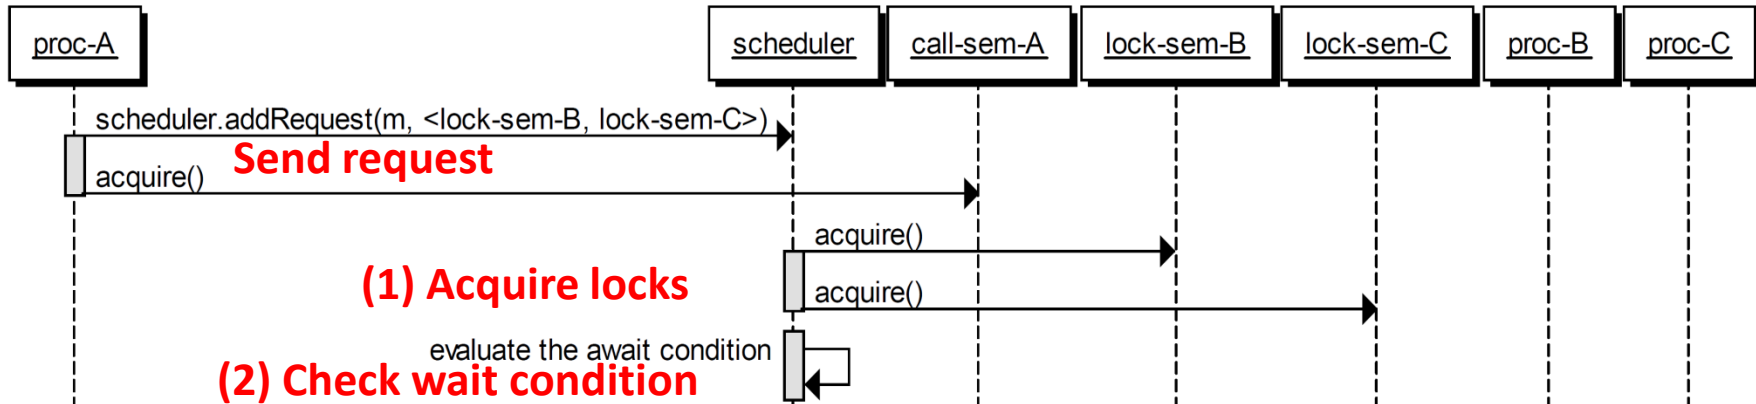

Dynamic behavior

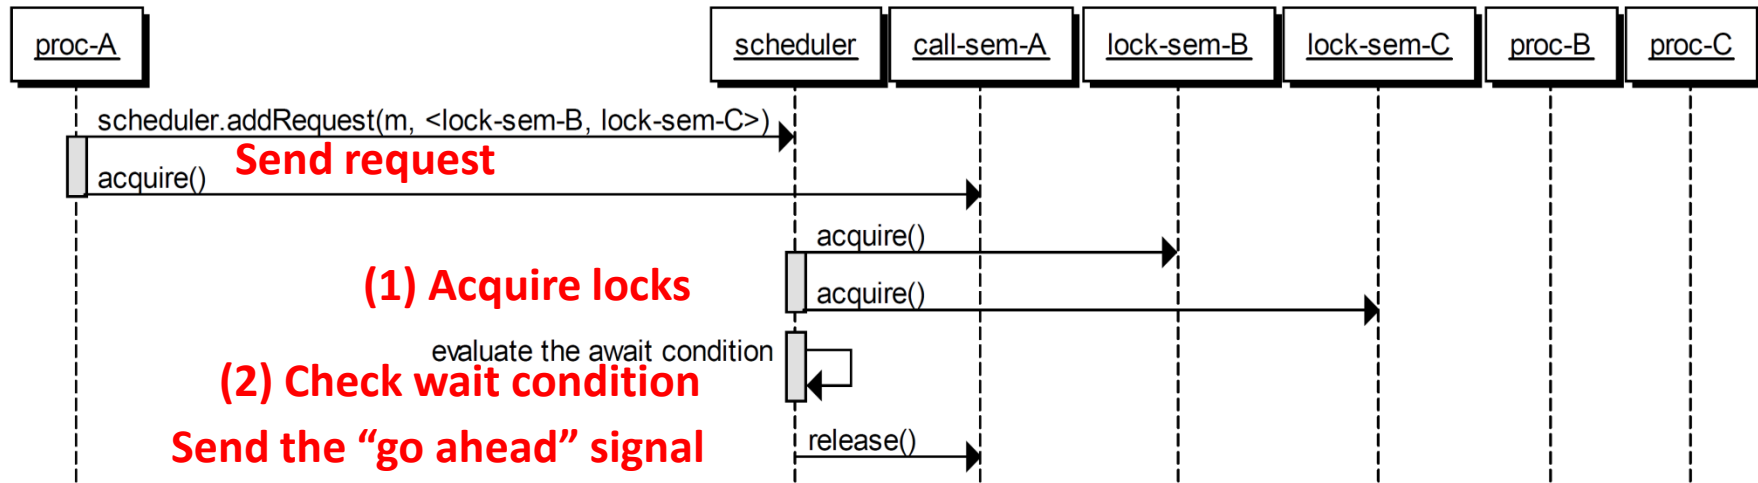

Dynamic behavior

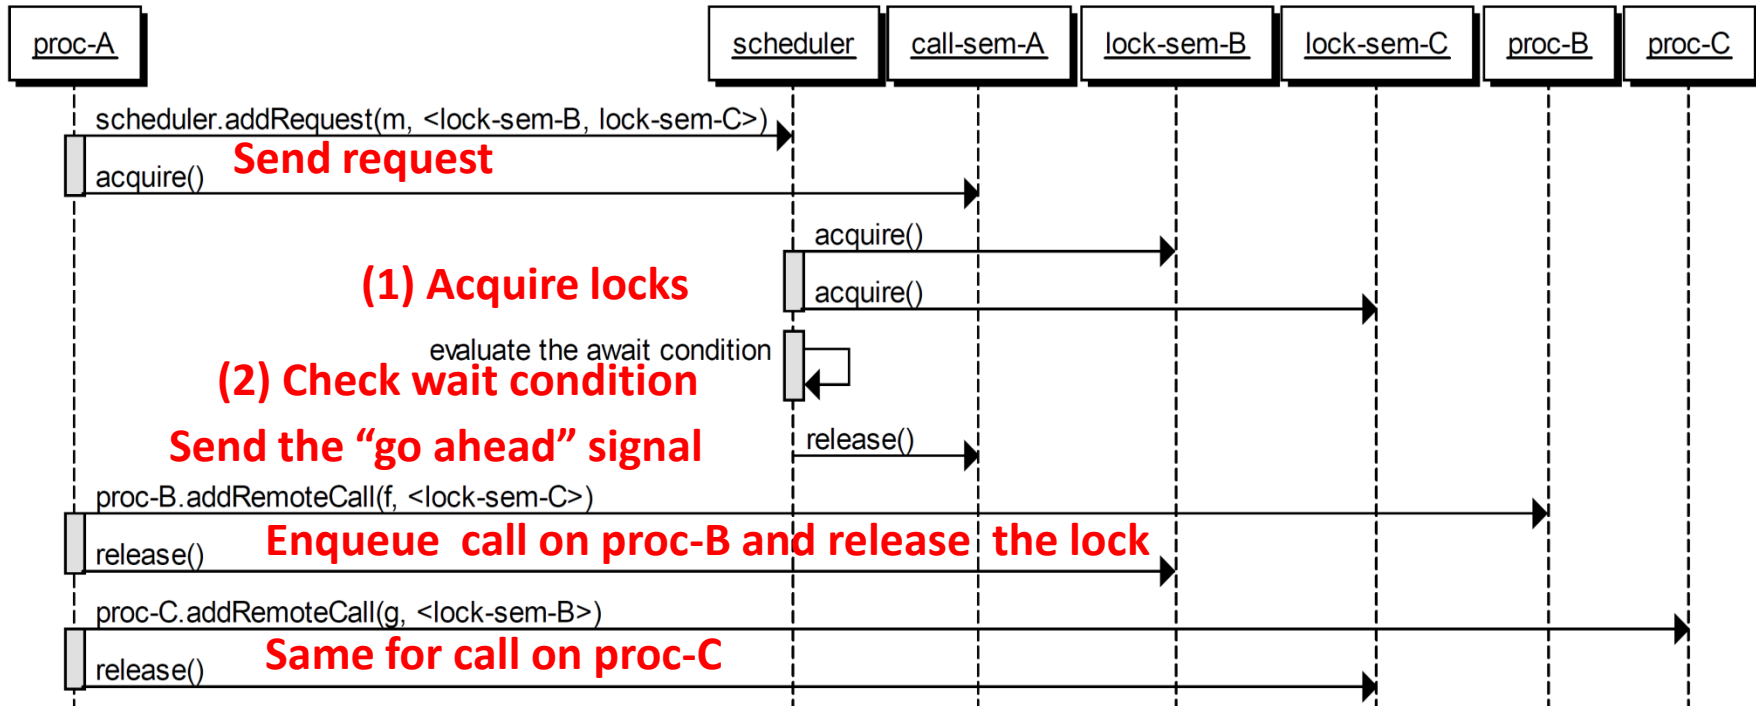

Dynamic behavior

Dynamic behavior

proc-A

scheduler call-sem-A lock-sem-B lock-sem-C proc-B proc-C

Dynamic behavior

Architecture

Translation rule for remote call

Annotated code

```
Class %ClassName {
  ...
  //method body containing a separate call
  %ReturnType %Method(%Type0 %SepArg,...);
  { ...
    %SepArg0.%SepMethod([%SepArg0,...,%SepArgN,...]);
    ...
  }
  ...
}

Class %Type {
  ...
  //supplier side
  void %SepMethod(%Type00 %Arg0,...%TypeNN %ArgN)
  { ... }
  ...
}
```

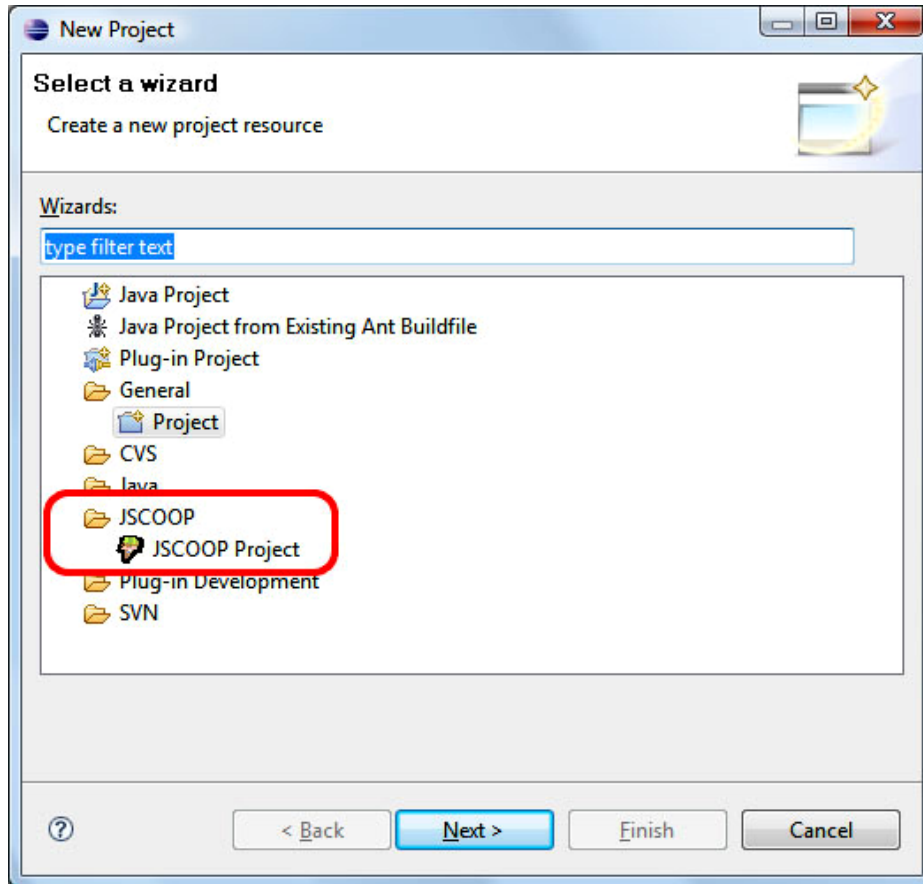

Input: annotated code

Translation

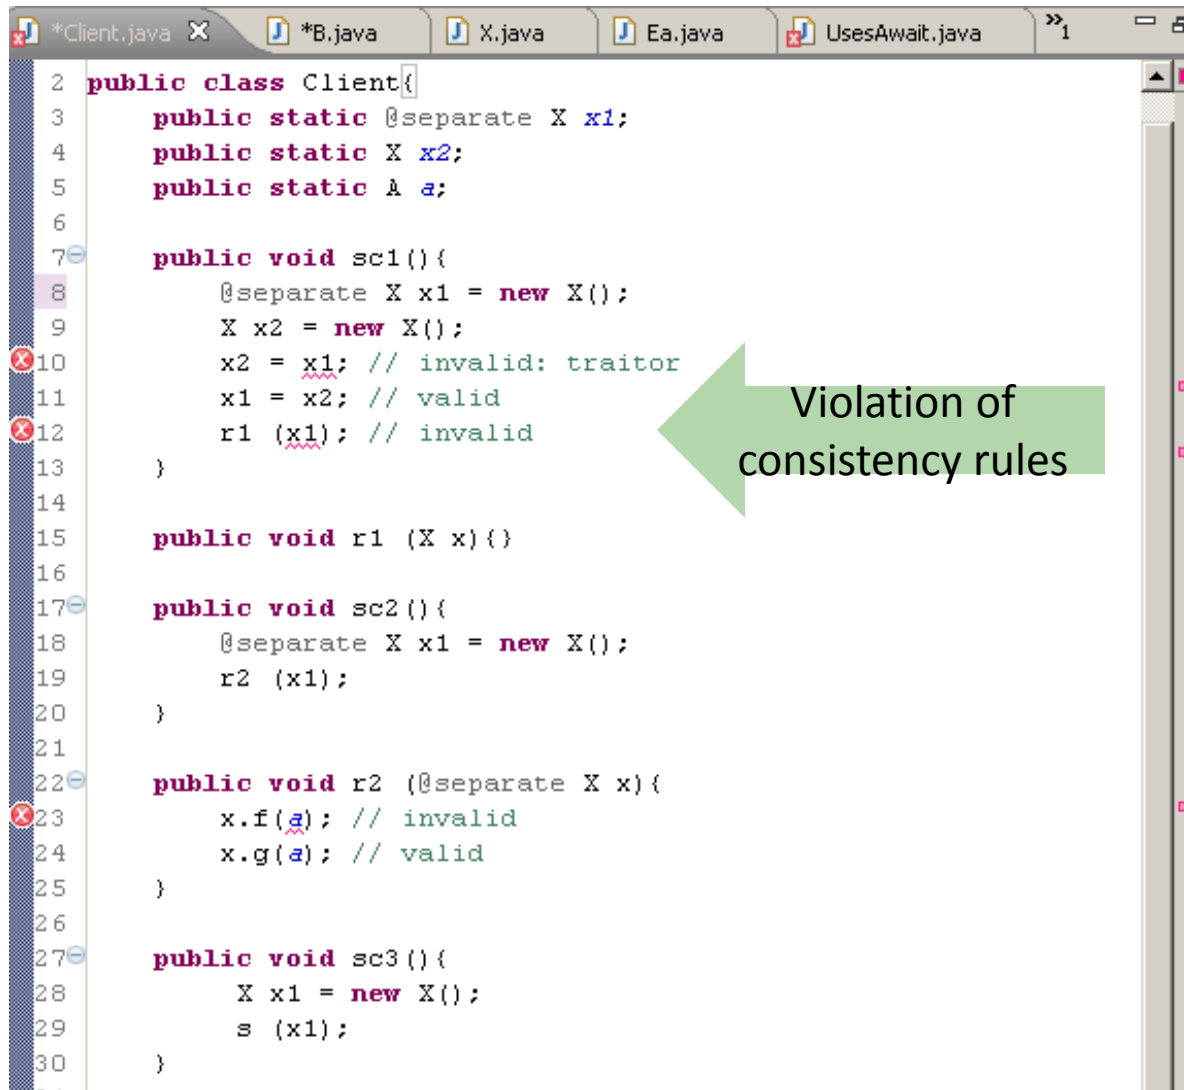

```
Class SCOOP_%ClassName {
  ...
  //translated method
  %ReturnType %Method(SCOOP_%Type0 %SepArg,...);
  { ...
    Call call;
    List<Processor> locks;
    //loop
    locks.add(%SepArg0.getProcessor());
    ...//do this for all separate arguments of %SepMethod
    locks.add(%SepArgN.getProcessor());
    //end loop
    lock_request = new LockRequest(%SepArg, locks,
      %SepArg.getProcessor().getLockSemaphore());
    List<Object> args_types, args;
    //loop
    args_types.add(%Type00); //use the SCOOP_ for separate types
    args.add(%Arg0);
    ...//do this for all arguments of %SepMethod
    args_types.add(%TypeNN);
    args.add(%ArgN);...
    //end loop
    call = new Call("%SepMethod", arg_types, args,
      void, lock_request, %SepArg0, void);
    %SepArg0.getProcessor().addRemoteCall(call);
    ...//move on to the next operation without waiting
  }
  ...
}
```

Output: multi-threaded using core library

Tool support: JSCOOP

Tool support: JSCOOP

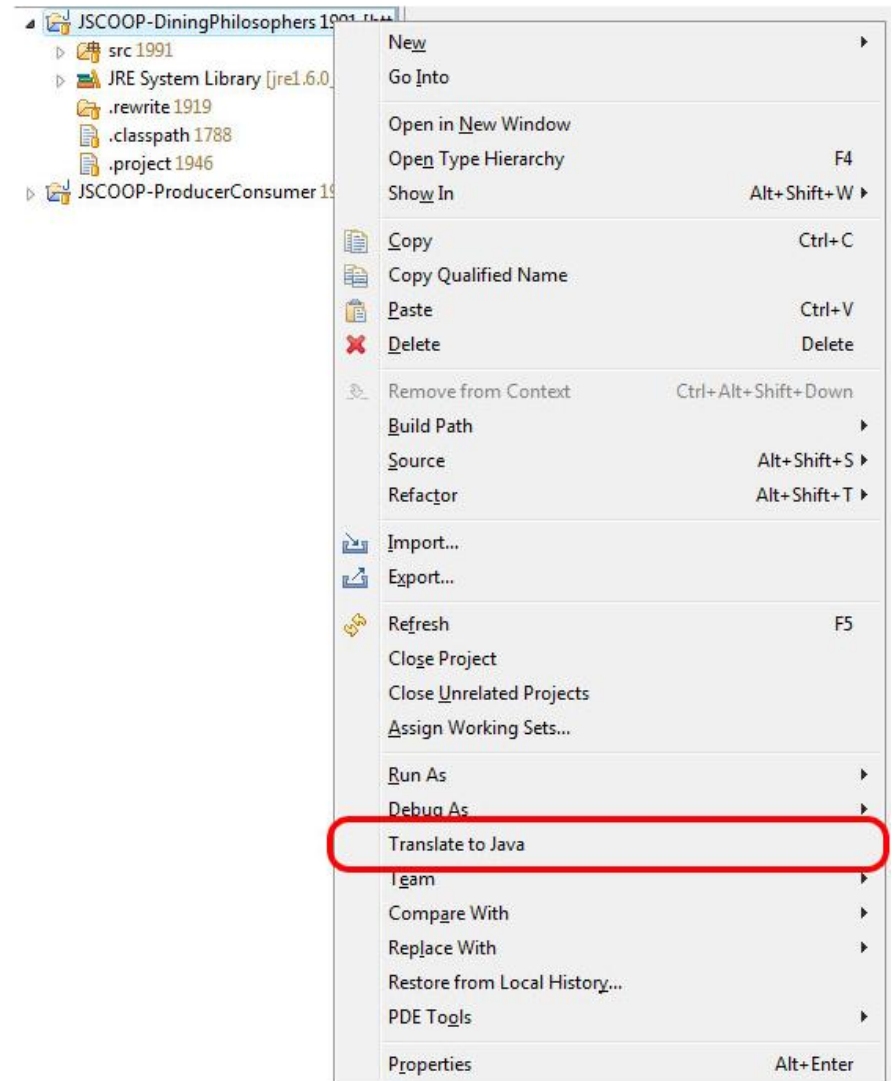

The screenshot shows an IDE window with several tabs: *Client.java, *B.java, X.java, Ea.java, and UsesAwait.java. The main editor displays the following Java code:

```
2 public class Client{
3     public static @separate X x1;
4     public static X x2;
5     public static A a;
6
7     public void sc1(){
8         @separate X x1 = new X();
9         X x2 = new X();
10        x2 = x1; // invalid: traitor
11        x1 = x2; // valid
12        r1 (x1); // invalid
13    }
14
15    public void r1 (X x){}
16
17    public void sc2(){
18        @separate X x1 = new X();
19        r2 (x1);
20    }
21
22    public void r2 (@separate X x){
23        x.f(a); // invalid
24        x.g(a); // valid
25    }
26
27    public void sc3(){
28        X x1 = new X();
29        s (x1);
30    }
31 }
```

A green arrow points from the text "Violation of consistency rules" to the line `x2 = x1; // invalid: traitor` on line 10. Red 'X' markers are visible in the left margin next to lines 10, 12, 23, and 27.

Tool support: JSCOOP

Limitations / Future work

- Not shown the correctness of translation
 - develop more examples in JSCOOP
 - check the bi-similar behavior to programs written in Java
- Need for empirical studies
 - assess the efficiency and effectiveness of the tool
- Add full support for inheritance and genericity
- **SCOOP is still prone to deadlocks**
 - Apply model-checking techniques to detect deadlocks at compile-time

Summary

- Design pattern for SCOOP that makes it feasible to apply the SCOOP concurrency model to other OO languages
 - Annotation processing and consistency checking
 - Core library
 - Translation rules
- A prototype implementation for Java based on an Eclipse plug-in called JSCOOP
- <http://code.google.com/p/jscoop>

Thank you!
